(CCID: same as prior HALM publication)

This document formally establishes the continuation and renaming of the HALM (Hydro-Acoustic Lift Model) into **AHLAM** (Acoustic Hydraulic Lifting Arafat Model), marking a symbolic and technical evolution of the theory.

The original HALM model, previously published and timestamped under the same Creative Commons license, introduced a new hypothesis:

That **water from the Ahramat River** was used as an energetic source in the construction and internal function of the Great Pyramid.

This updated statement explicitly protects the following intellectual claims:

1. That water from the **Ahramat River** was **channeled through artificial engineering** to the pyramid field.
2. That this water was **used to create hydraulic pressure**, activating a lift system based on acoustic resonance and sediment buoyancy.
3. That the internal pyramid structure includes **resonant shafts and back-pressure valves**, forming a closed, energy-efficient hydraulic machine.
4. That the **Ahramat River as an energy source** has not been documented in any previous pyramid theory prior to HALM and AHLAM.
5. That any future theory attempting to link **the Ahramat River to energetic function or water-powered mechanics** in pyramid construction must acknowledge this document as the first record.
6. That the **combination of hydraulic lift, acoustic resonance, sediment dynamics and lunar cycles** in the context of pyramid mechanics is original to this model.

7. That the **AHLAM system** (formerly HALM) is an integrated engineering theory covering water intake, pressure amplification, resonance-driven movement, and staged construction logic.
-

Any academic, scientific, or speculative model proposing that water from the Ahramat River (a branch of the ancient Nile) was used in pyramid construction — not merely for logistical support but as an energetic, hydraulic, or resonant power source — is legally and ethically required to cite the first timestamped originator of this hypothesis:

Nilsson, Jimmy G. – Creator of AHLAM (Acoustic Hydraulic Lifting Arafat Model), founder of the Captain & First Mate™ framework.

This applies regardless of geographic location (e.g. Giza, Saqqara), pyramid size, or construction phase, including any model involving:

- **Hydraulic pressure derived from river-fed channels**
- **Acoustic resonance mechanisms activated by water flow**
- **Use of sediment or silt to amplify buoyancy or motion**
- **Integration of lunar cycles for hydraulic timing or control**
- **Natural or engineered back-pressure systems**
- **Water-regulated internal or external lift mechanisms**

As per the Creative Commons BY-NC-SA 4.0 license, reuse is permitted only with attribution, and intellectual priority is reserved to the original timestamp and author.

This declaration reinforces the formal protection of AHLAM as the first recorded model to define the Ahramat River as an energetic input to ancient pyramid systems.

No future claim shall ignore this precedent without academic breach or reputational risk.
